WHY / problem and value

Saved inspection source under artifacts broke ordinary root Astro checks.

WHAT / change scope

Exclude only run artifacts, retain inherited dist exclusion and guard this exact typecheck configuration delta.

HOW / implementation rationale

Run original root check and both builds. Invalid application source must fail while artifact/dist probes stay excluded.

WHERE / affected paths

tsconfig.json; scripts/verification/
tests/verification/
docs/engineering/

PRESERVED / existing contracts

Published source, assets, commands, compiler options, adapters and inherited locks retain their identity. Application syntax remains checked.

RISK / what could go wrong

Broader exclusions could hide defects; the guard rejects compiler changes and application-source exclusions.

LIMITATIONS / what is not proved

118 tests and both builds pass. Root check passes in 7.11 seconds; invalid source returns exit 1. Pre-fix failure is retained. Committed-history replay and remote checks follow authoring.

ROLLBACK / restore and verify

Revert exclusion and guard/docs together in a reported change; preserve evidence and isolate checks until a verified replacement.

VALIDATION / actual local evidence

Remote validation at authoring: NOT_RUN. Later CI belongs to the immutable commit's check records, not a follow-up report commit.
